Figure 6

Figure 6 shows two plots related to the model fit. The top plot displays the observed values (y_i) against the predicted values ($\hat{y}_i$). The bottom plot displays the residuals (e_i) against the predicted values ($\hat{y}_i$).

- **Prevalence** – the proportion of the population with a disease at a particular point in time
- **Incidence** – the number of new cases of a disease in a particular population over a defined period of time

Figure 1 illustrates the experimental setup. A subject is seated at a table, viewing a video screen. A camera is positioned above the screen. A target is located on the screen. A horizontal line is drawn on the screen, representing the target position. The subject's hand is positioned at the starting point. The distance between the starting point and the target is labeled as 'D'. The distance between the starting point and the video screen is labeled as 'L'. The distance between the video screen and the target is labeled as 'd'.

- **Prevalence** = the proportion of a population that has a disease at a particular point in time
- **Incidence** = the proportion of a population that develops a disease over a period of time
