Figure 1. The effect of the *Salmonella* serotype on the survival of *Salmonella* in the water. The survival of *Salmonella* in the water was measured by the number of viable cells (log CFU) after 24 h of exposure to water. The data were presented as the mean $\pm$ SD of three independent experiments. The significance of the difference between the serotypes was determined by the one-way ANOVA test. The significance level was set at $p < 0.05$.
